Corrosion: The Most Pervasive Threat

Corrosion remains the most common cause of equipment failure in refineries. API RP 571 provides an extensive discussion on various forms:

- General Corrosion: Uniform material loss due to chemical or electrochemical reactions. Usually predictable but can lead to significant wall thinning if unchecked.

- Localized Corrosion:

- Pitting: Small, deep pits that can penetrate metal rapidly.

- Crevice Corrosion: Occurs in confined spaces where stagnant conditions develop.

- Filiform Corrosion: Under film formation on painted or coated surfaces.

- Environmental Cracking:

- Stress Corrosion Cracking (SCC): Crack propagation due to combined tensile stress and corrosive environment.

- Corrosion Fatigue: Damage caused by cyclic stresses in corrosive environments.

The report emphasizes the importance of understanding the operating environment?pH, temperature, chloride content, and material susceptibility?to predict corrosion risks.

Key Recommendations:

- Regular monitoring of corrosion rates.

- Use of corrosion-resistant alloys where necessary.

- Implementation of protective coatings and cathodic protection.

- Designing equipment to minimize crevices and stagnant zones.

Stress Corrosion Cracking (SCC)

SCC is particularly insidious due to its ability to cause sudden, catastrophic failures with minimal prior signs.

Mechanism:

SCC involves the initiation and propagation of cracks under tensile stress in a corrosive environment. It is influenced by:

- Material susceptibility

- Environmental factors such as chlorides, sulfides, or caustic solutions

- Stress levels, both residual and operational

Detection and Prevention:

- Lifestyle assessments to identify high-risk areas.
- Use of materials with improved SCC resistance.
- Controlling environmental parameters, such as pH adjustment or corrosion inhibitors.
- Conducting regular non-destructive testing (NDT) for early crack detection.

Significance:

The report underscores that SCC often occurs in welds, heat-affected zones, and areas of stress concentration. Vigilance in inspection and material selection is vital.

Hydrogen-Related Damage

Hydrogen-induced damage mechanisms are critical, especially in refining processes involving hydrogen exposure.

- Hydrogen Embrittlement: Loss of ductility and toughness, leading to brittle fracture.
- Hydrogen Attack: Formation of methane within the steel, resulting in internal cracking and swelling.

Key Factors:

- Operating temperature and pressure.
- Material composition and microstructure.
- Presence of moisture and corrosive agents.

Mitigation Strategies:

- Use of low-hydrogen materials or coatings.
- Controlling process parameters to limit hydrogen exposure.

Mechanical Damage & Operational Factors

Mechanical Damage

- Erosion and Wear: Caused by high-velocity fluids, solids, or abrasive particles.
- Fatigue: Repeated cyclic stress can lead to crack initiation and propagation.

Operational Impacts

Operational conditions significantly influence damage mechanisms:

- High temperature and pressure can accelerate creep and thermal fatigue.
- Fluid velocity and composition affect erosion and corrosion.
- Process upsets and transient operations introduce stress and damage risks.

Thermal Fatigue and Creep

Thermal fatigue results from cyclic temperature variations, leading to crack initiation over time. Creep becomes prominent at elevated temperatures, causing slow deformation and eventual failure.

Best Practices:

- Design equipment to minimize thermal gradients.
- Implement controlled start-up and shutdown procedures.
- Regularly monitor for signs of deformation or cracking.

Metallurgical Issues and Damage

The document discusses various metallurgical phenomena:

- Embrittlement: Caused by factors like hydrogen, oxygen, or impurities.
- Cracking: Including hot cracking, cold cracking, and delayed cracking.
- Microstructural Changes: Such as grain growth, phase transformations, or carbide precipitation affecting strength and toughness.

Understanding the metallurgical state of the material is critical for predicting damage and planning maintenance.
