Intermolecular Forces and Liquids

The behavior of liquids is governed by intermolecular forces:

- Van der Waals forces: Weak attractions that influence boiling points and volatility.
- Hydrogen bonding: Stronger interactions, especially in water, leading to anomalous properties such as high surface tension and specific heat capacity.
- Cohesion and adhesion: Cohesion refers to molecules sticking together; adhesion involves molecules sticking to other surfaces, critical in capillarity and biological systems.

The balance of these forces determines a liquid's physical properties, stability, and reactivity.

Liquids in Nature: The Lifeblood of the Planet

Water: The Essential and Enigmatic Molecule

Water is arguably the most vital liquid on Earth, covering approximately 71% of the planet's surface and constituting about 60% of the human body. Its unique properties?such as high specific heat, solvent capabilities, and surface tension?are instrumental in supporting life.
