Question 1: Multiple Choice

Which of the following organelles is responsible for energy production in the cell?

- a) Nucleus
- b) Mitochondria
- c) Chloroplast
- d) Ribosome

Answer: b) Mitochondria

Explanation: Mitochondria are known as the powerhouse of the cell because they generate ATP, the energy currency of the cell, during cellular respiration.

Question 2: Short Answer

Define photosynthesis and state the importance of this process to plants and animals.

Answer: Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules, using carbon dioxide and water, with the help of chlorophyll. This process is vital because it produces oxygen necessary for respiration in animals and provides the primary energy source for the food chain.

Question 3: Diagram Labeling

Draw and label the human heart, indicating the four chambers and major blood vessels.

Answer:

Students should draw a diagram of the human heart with the following labels:

- Right Atrium
- Right Ventricle
- Left Atrium
- Left Ventricle
- Aorta
- Pulmonary Artery
- Pulmonary Vein
- Vena Cava (Superior and Inferior)

Tip: Ensure clarity and accuracy in labeling to score full marks.

Question 4: Essay/Long Answer

Describe the process of transpiration in plants and explain how it affects water movement.

Answer:

Transpiration is the evaporation of water vapor from the stomata of plant leaves. It occurs mainly through tiny openings called stomata, which regulate gas exchange. Transpiration creates a negative pressure in the xylem vessels, which helps in drawing water upward from the roots through capillary action. This process not only cools the plant but also facilitates the transport of minerals and nutrients from the soil to the leaves. Excessive transpiration can lead to water stress, while reduced transpiration may affect nutrient uptake.

Sample Questions and Detailed Answers from 2014

To illustrate the depth and scope of the 2014 exam, here are select questions with comprehensive explanations:

Question 1: Cell Structure and Functions

Describe the main differences between a plant cell and an animal cell. Use diagrams to support your answer.

Answer:

Feature	Plant Cell	Animal Cell
Cell Wall	Present; made of cellulose, provides rigidity	Absent
Chloroplasts	Present; contain chlorophyll for photosynthesis	Absent
Vacuole	Large central vacuole, maintains turgor pressure	Small or absent
Shape	Usually rectangular or fixed shape	Irregular and flexible
Centrioles	Usually absent in mature plant cells; present in animal cells	Present

Explanation:

Plant cells have a rigid cell wall and chloroplasts, enabling photosynthesis and structural support. Animal cells lack these features but contain centrioles involved in cell division. The large central vacuole in plant cells stores water and maintains shape, whereas animal cells have smaller vacuoles or none.

Question 2: Human Circulatory System

Explain the pathway of blood through the human heart, including the chambers involved.

Answer:

Blood flow through the heart follows this sequence:

- Deoxygenated blood from the body enters the right atrium via the vena cava.
- The right atrium contracts, pushing blood through the atrioventricular (tricuspid) valve into the right ventricle.
- The right ventricle contracts, pumping blood through the pulmonary valve into the pulmonary arteries.
- Blood is transported to the lungs for oxygenation.
- Oxygenated blood returns to the left atrium via the pulmonary veins.
- The left atrium contracts, sending blood through the bicuspid (mitral) valve into the left ventricle.
- The left ventricle contracts powerfully, pumping blood through the aortic valve into the aorta, distributing it to the body.

Key Point: The heart's chambers work in a coordinated manner to ensure unidirectional blood flow, with valves preventing backflow.

Question 3: Photosynthesis Process

Describe the process of photosynthesis, including the raw materials and the end products.

Answer:

Photosynthesis is the process by which green plants convert light energy into chemical energy. It occurs mainly in the chloroplasts of leaf cells.

Raw materials:

- Carbon dioxide (CO₂) from the atmosphere
- Water (H₂O) absorbed by roots
- Light energy from the sun

Process steps:

- Light absorption by chlorophyll triggers the conversion of light energy into chemical energy.
- The energy splits water molecules (photolysis), releasing oxygen (O₂) as a byproduct.
- The Calvin cycle uses ATP and NADPH produced in the light-dependent reactions to fix CO₂ into glucose.

End products:

- Glucose (C₆H₁₂O₆), which serves as energy and building material
- Oxygen (O₂), released into the environment

Significance: Photosynthesis is vital for life on Earth, providing oxygen and organic compounds.
